

# Analog Front-End Cost Reduction for Multi-Antenna Transmitter

A faded background image of a man and a woman smiling. The man is on the left, wearing a light-colored shirt, and the woman is on the right, wearing a dark top. They appear to be in a professional setting.

# Overview

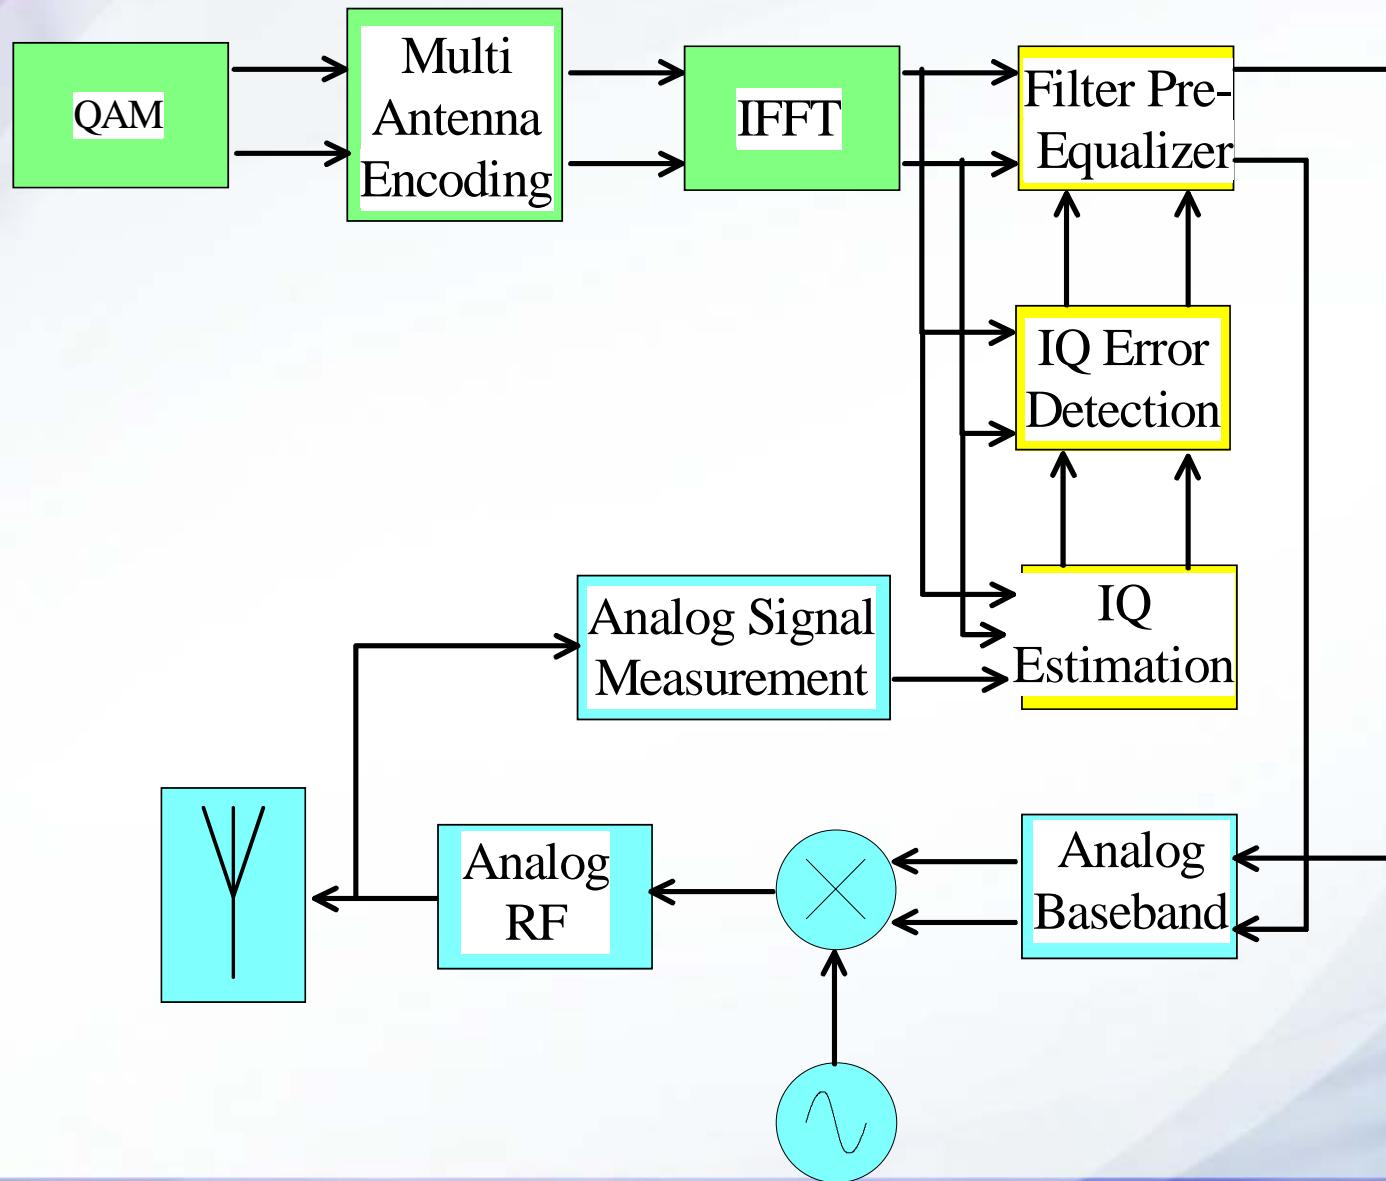

- Multi-antenna system
- Cost reduction
- Transmitter architecture – hardware and software
- Simulation results
- Conclusion

# Multi-antenna system

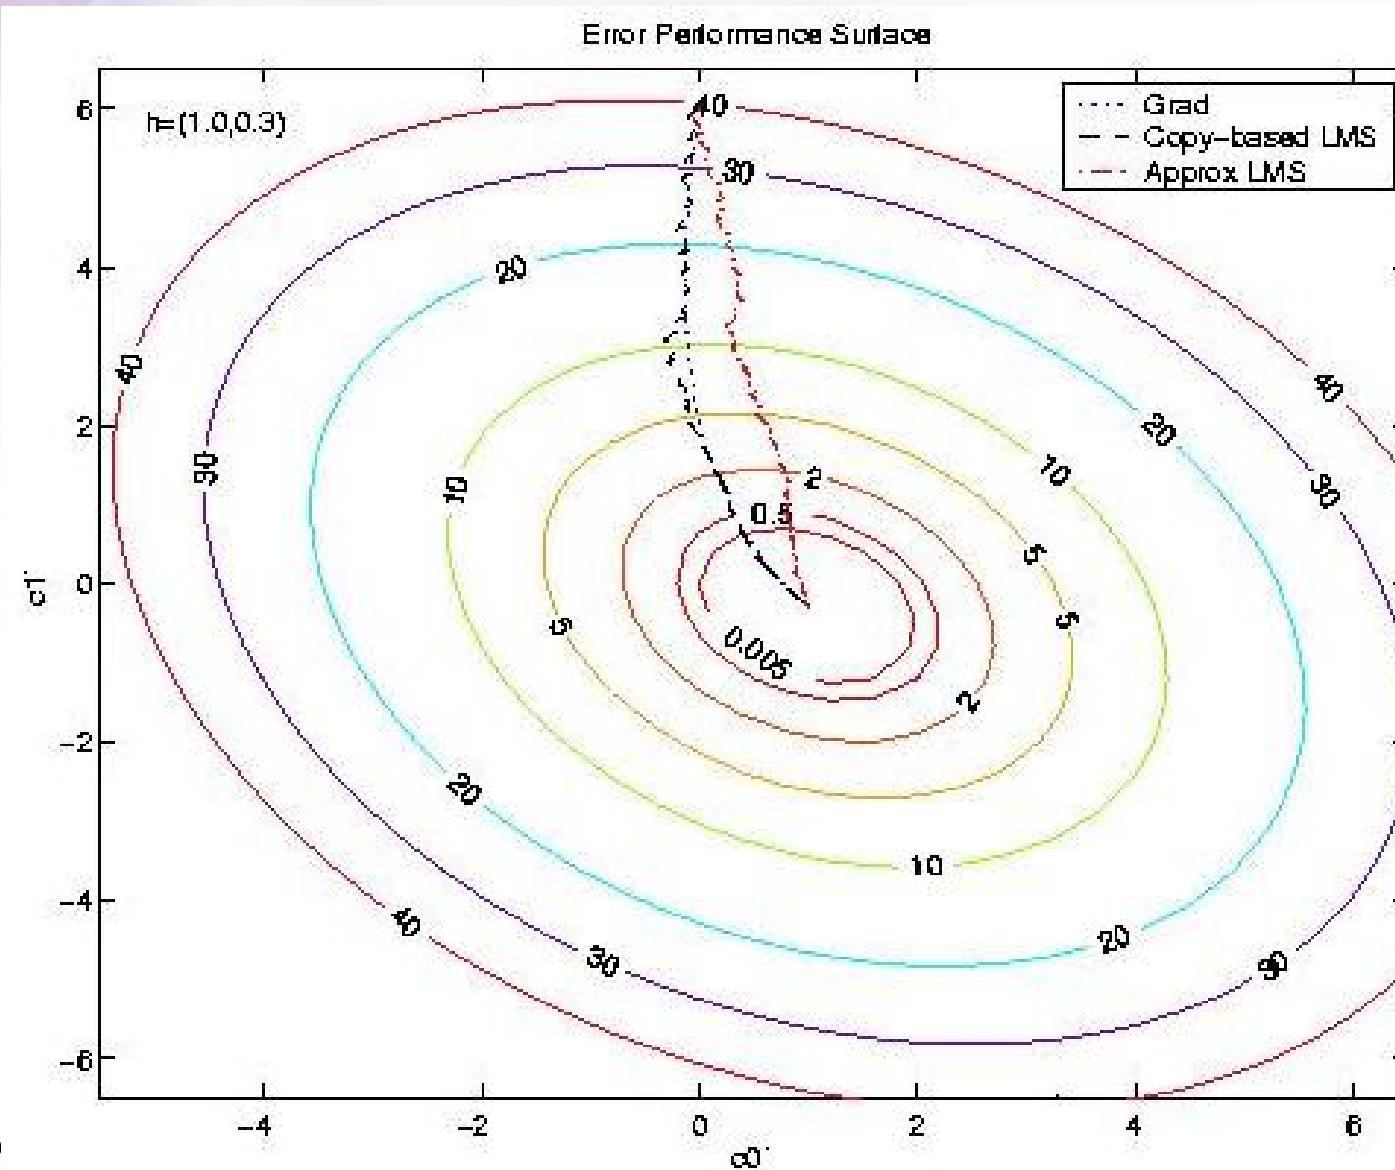

- High data rates, improved system performance
- Cost reduction through low cost analog components

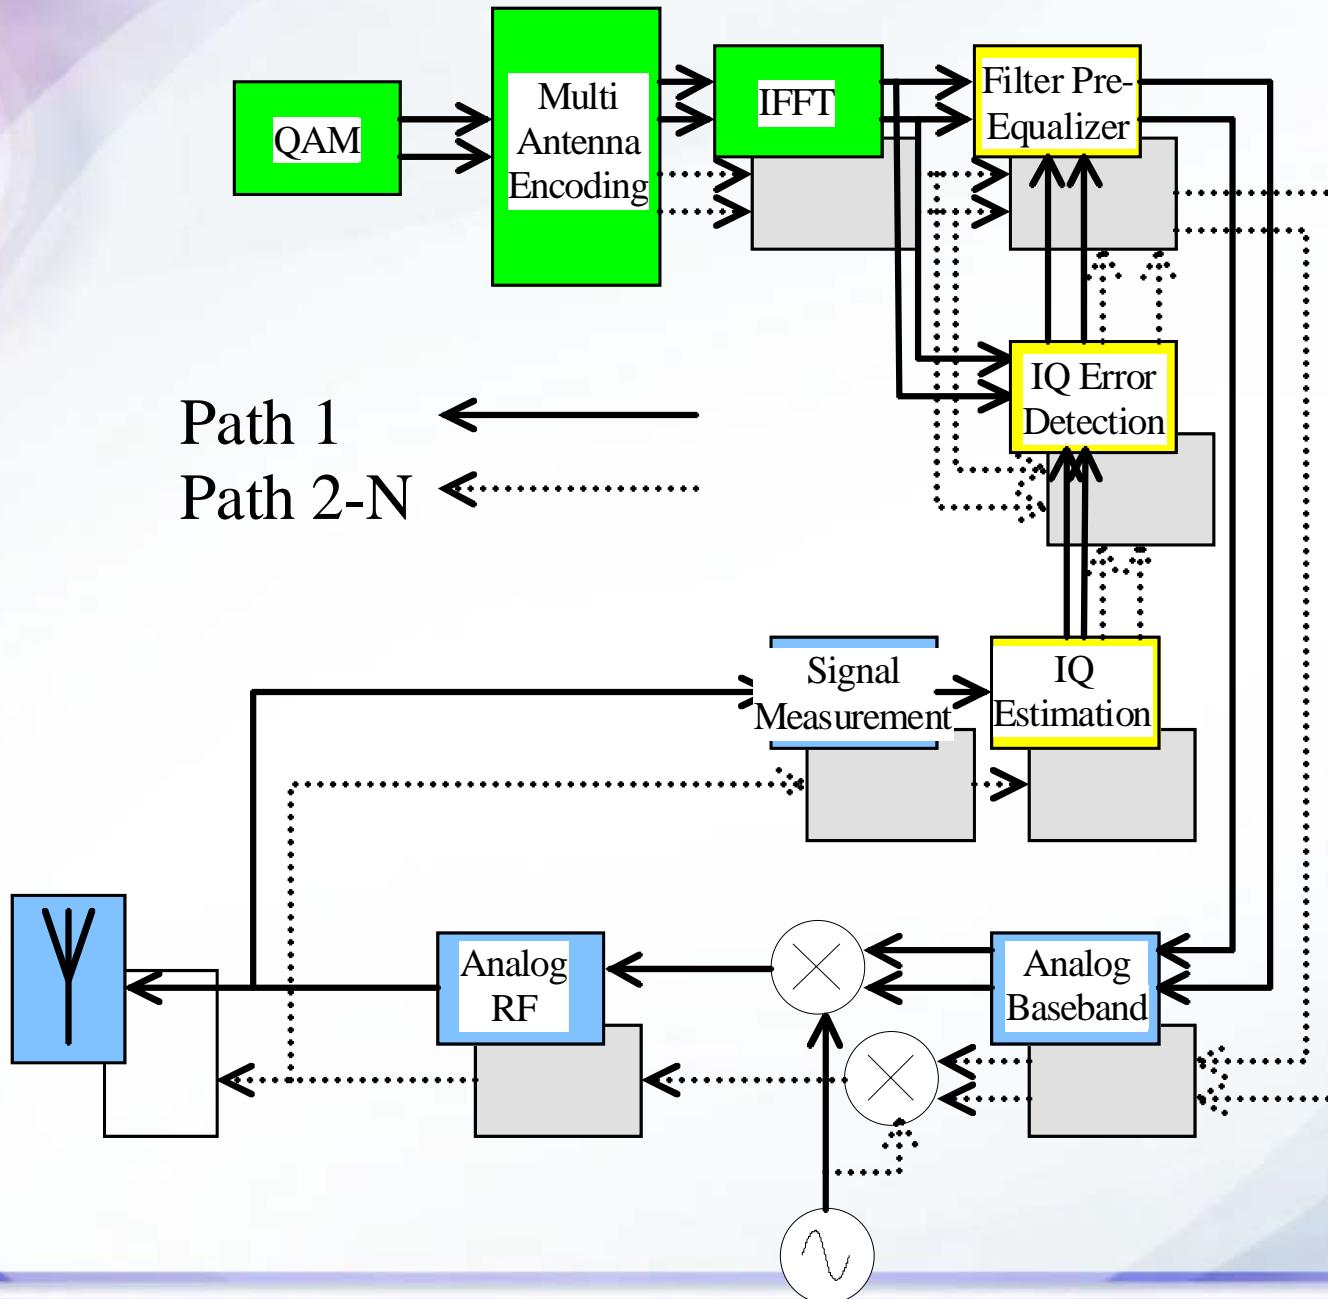

# Transmitter architecture

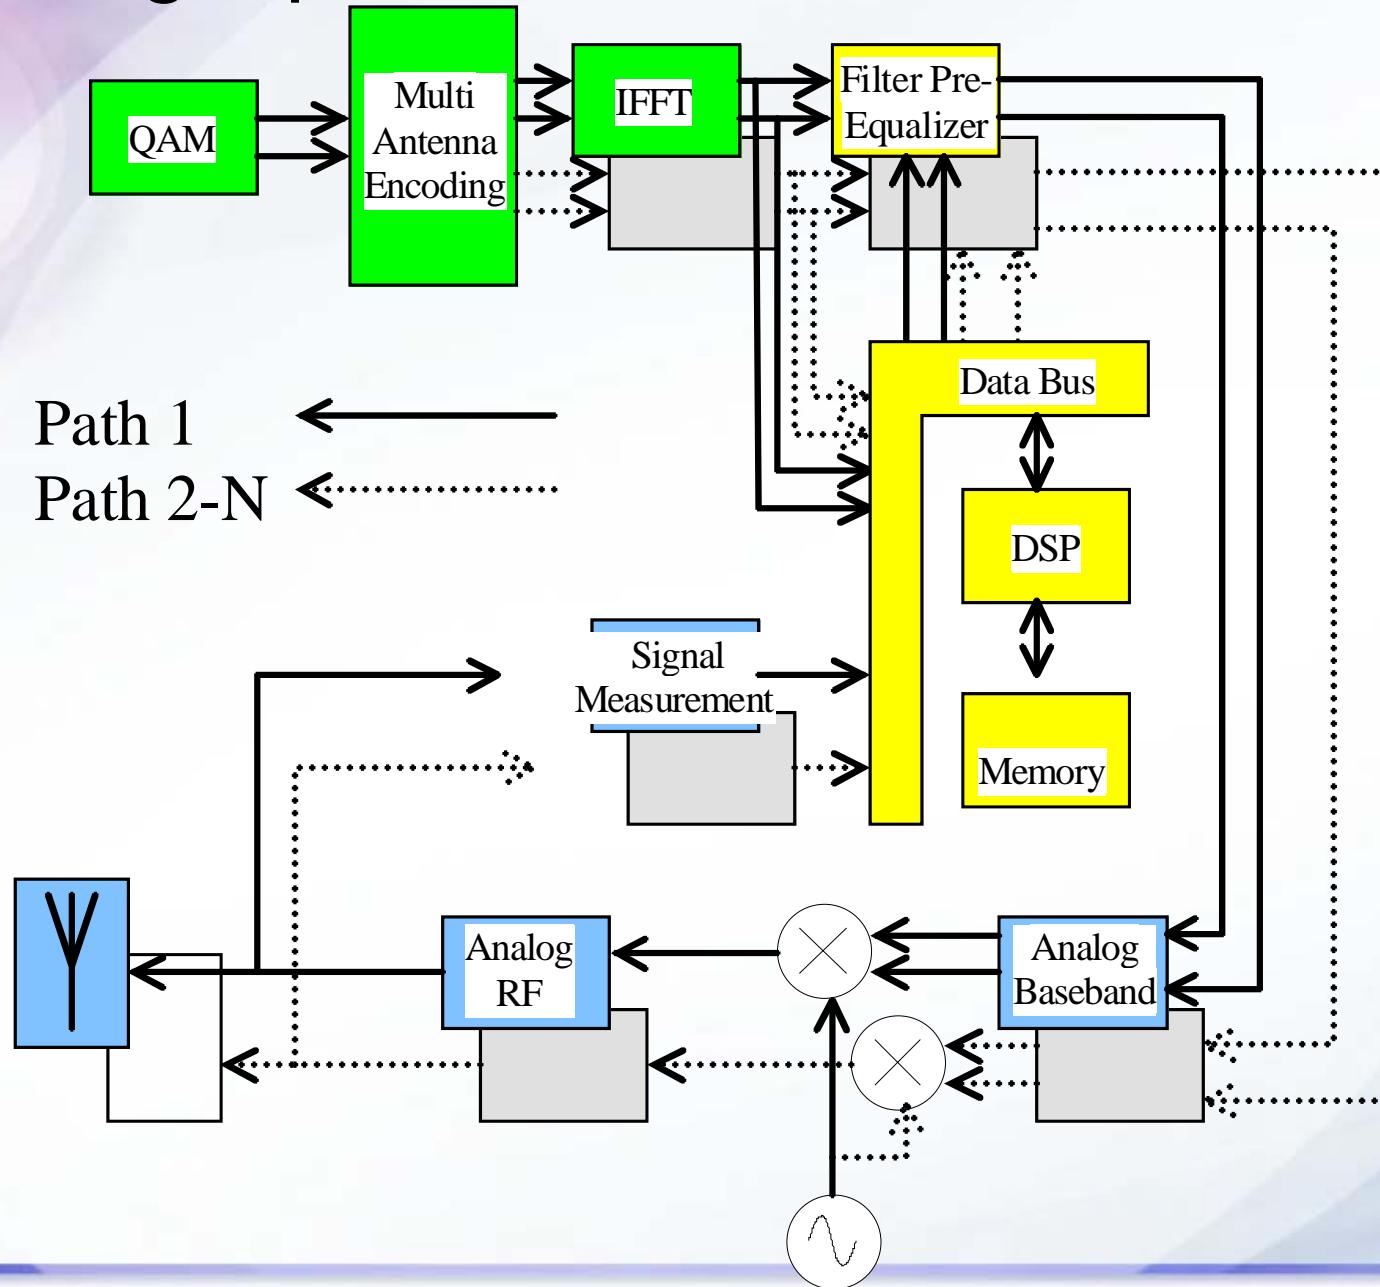

# Error performance surface

# Multi-antenna transmitter architecture

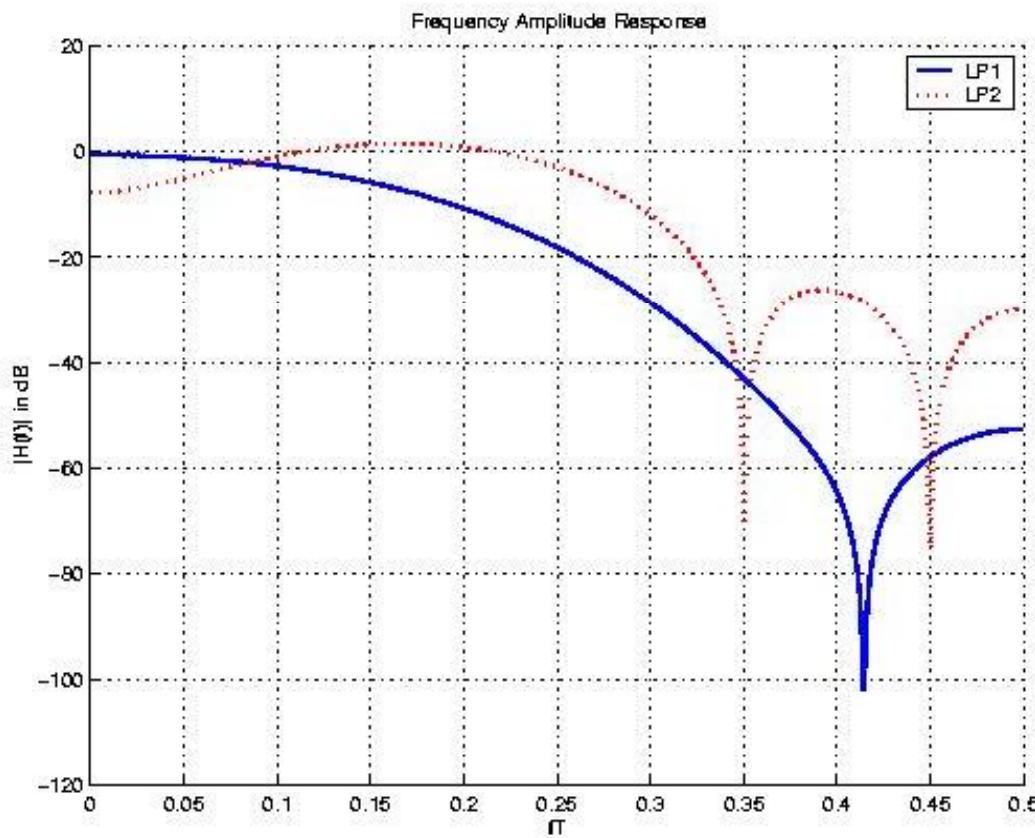

# Single processor for several branches

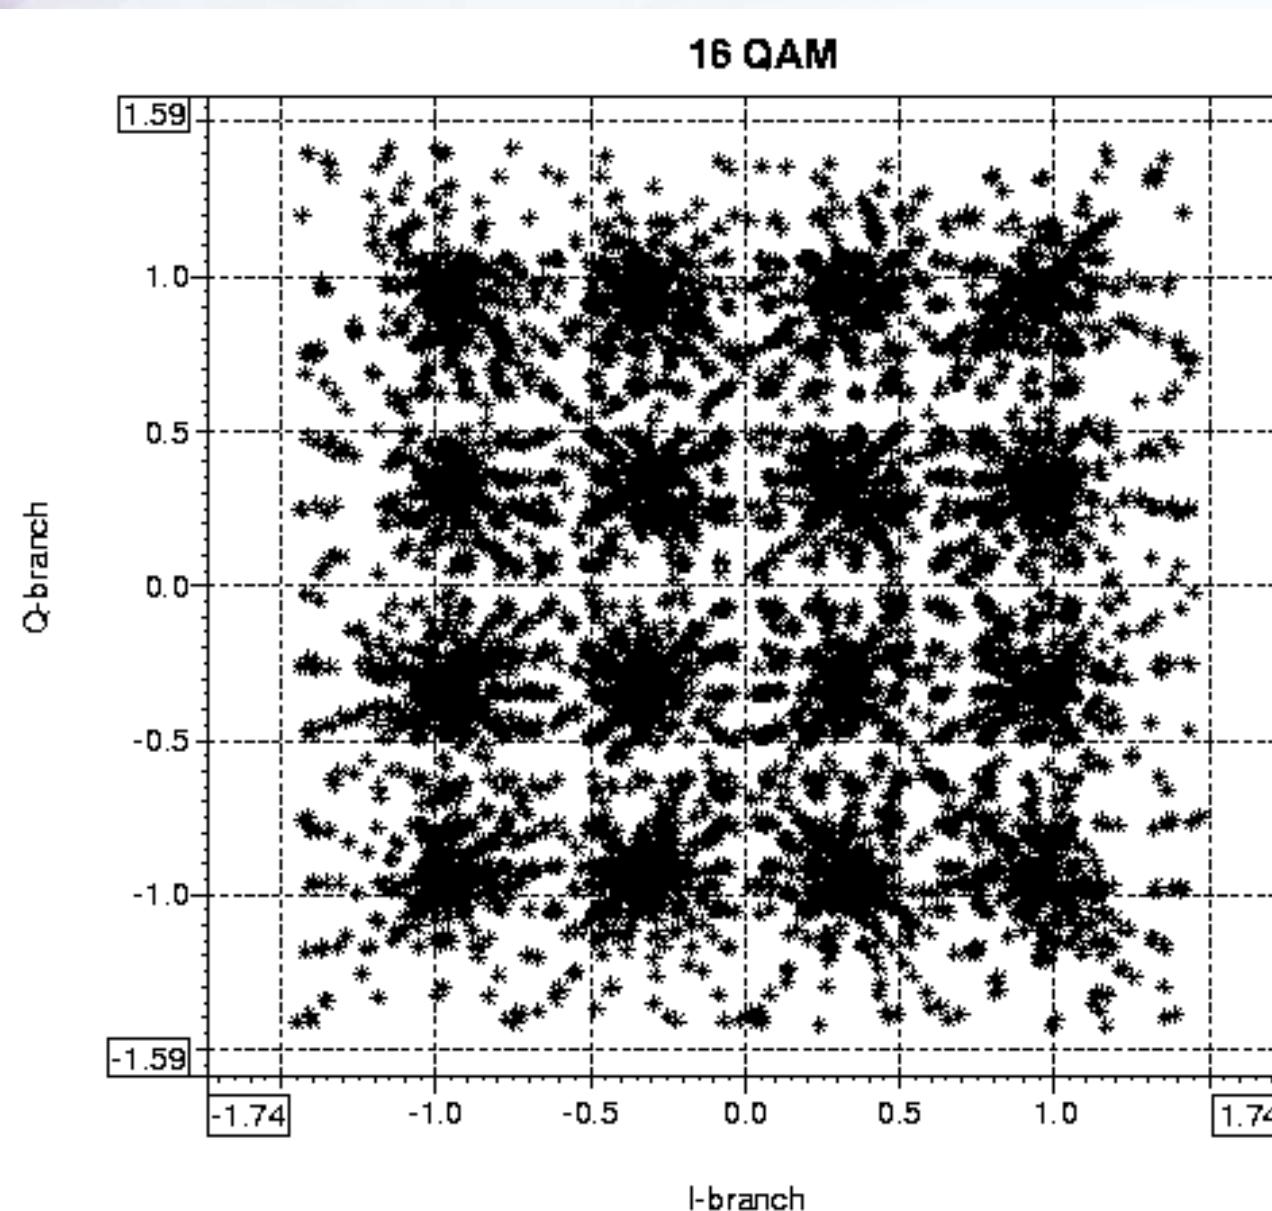

# Imperfect analog filter frequency response

- Two different imperfect analog filters for I- and Q- branch
- Imperfections are pre-compensated in digital domain

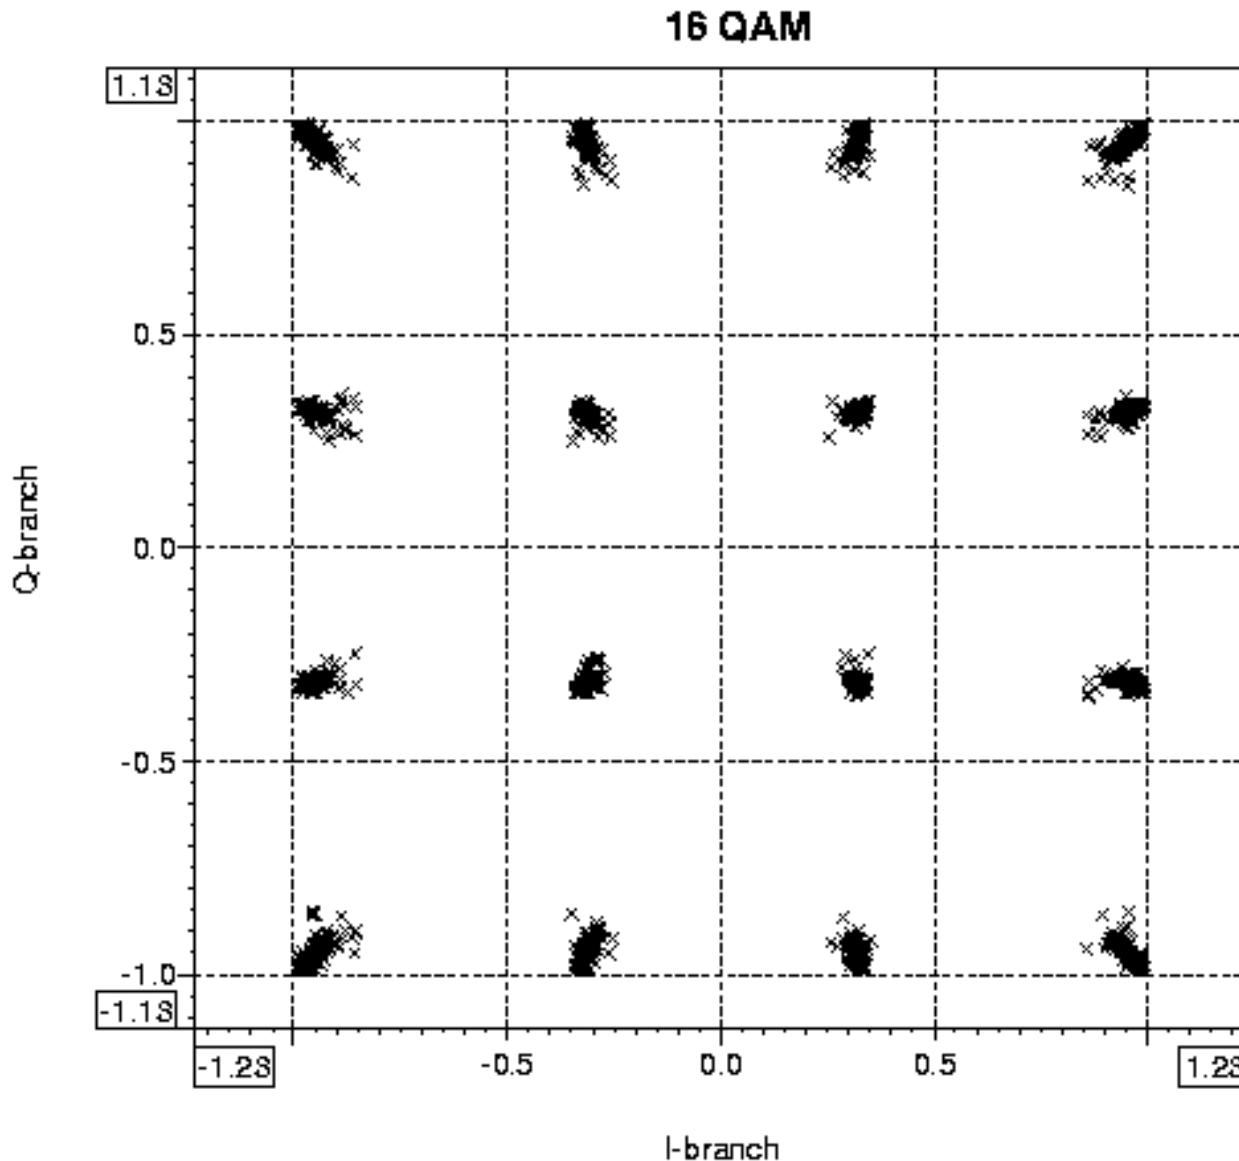

NOKIA

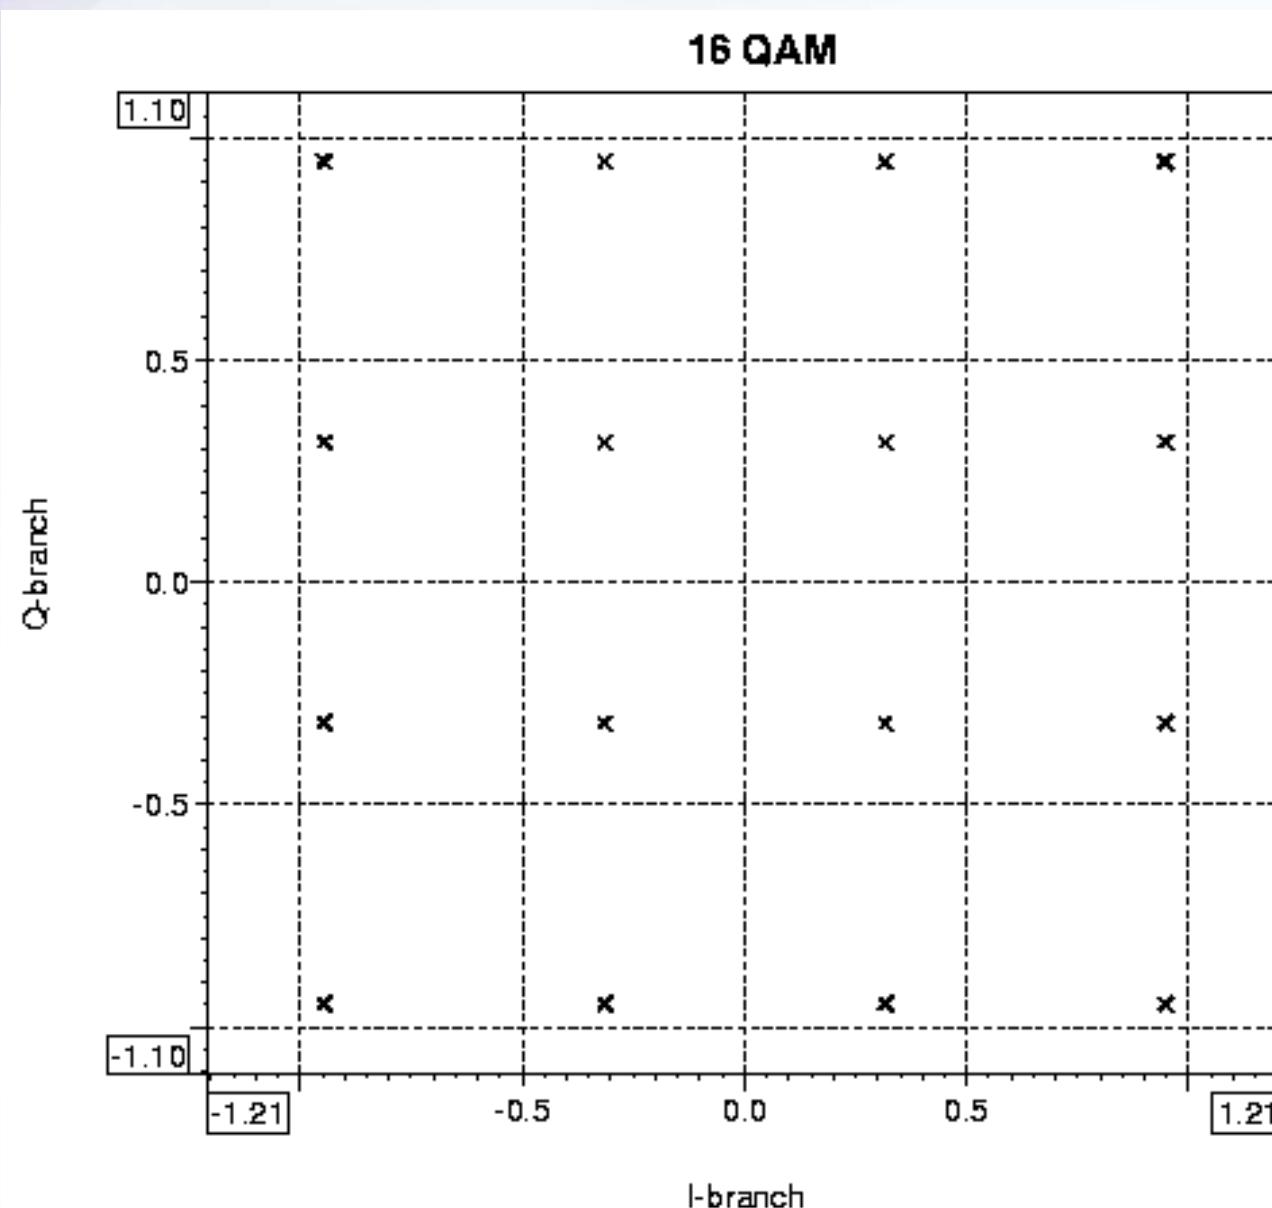

# Imperfect 16-QAM

# 16-QAM with 3-coefficient pre-equalizer

# 16-QAM with 19-coefficient pre-equalizer

# Conclusion

- Multi-antenna transmitter requires cheap analog front-ends
- Digital pre-equalization compensates imperfect analog filters
- Software-based pre-equalization approach reduces hardware costs
